

Deaths

DEATHS

- The International Classification of Diseases Tenth Revision (ICD-10) was used for coding the 1999 through 2003 underlying cause of death. Changes from the previously used ICD-9 to the ICD-10 revision can make year-to-year comparisons misleading. ICD-10 contains major changes, so that a greater or fewer number of deaths are now assigned to certain causes than under ICD-9 rules. Causes which changed the most include Alzheimer's disease, syphilis, and pneumonia. See pages x through xiii for further explanation and detailed comparability ratios.
- Through 1960 Age-Adjusted Death Rates (AADR) were calculated using the 1940 standard million population. For 1970 and forward, AADR calculations used the projected 2000 standard million population.
- In 2003, Florida resident deaths increased to a record high 168,459; however, the increase from 2002 was only 0.5 percent.
- The overall resident death rate per 1,000 population decreased slightly. The rate remained decreased white males, white females, and nonwhite females, but remained constant for nonwhite males.
- Of all resident deaths, 9.2 percent were to persons of Hispanic origin.
- Among whites, cremations outnumbered burials 52.7 percent to 32.3 percent. For blacks, burials outnumbered cremations 72.0 percent to 18.9 percent. For others, cremations outnumbered burials 48.4 percent to 38.0 percent.
- Heart disease was the leading cause of death — almost three of every 10 deaths.
- Malignant Neoplasm (Cancer) was the second leading cause of death, accounting for almost one of every four deaths.
- Unintentional Injury (Accident) was the leading cause of death for individuals aged 1-4, 5-9, 10-14, 15-19, 20-24, 25-34, and 35-44, accounting for 32.0 percent of the deaths in these age groups combined.
- There were 28 more HIV deaths in 2003 than in 2002 – a 1.6 percent increase.
- The resident HIV death rate for nonwhite males (42.8 per 100,000 population) is more than the rates for white males, white females and nonwhite females combined.
- HIV was the fourth leading cause of death in persons 25-34 years old, accounting for 8.2 percent of the total deaths — down from 9.2 percent in 2002.
- The homicide death rate decreased for all groups: white males, white females, nonwhite males, and nonwhite females. The rate for nonwhite males was more than double the combined rate for white males and white females.
- The major external causes of death (Unintentional Injury, Suicide, and Homicide) accounted for 6.6 percent of all resident deaths.
- Malignant Neoplasm (Cancer) was the leading cause of death for individuals aged 45-54, 55-64, and 65-74 — 34.5 percent of the total deaths in these age groups combined.

¹ For 1998 and prior years, maternal death are defined as occurring within a 42 day post-pregnancy interval and are assigned to ICD9:630-676 codes. For 1999 and forward maternal deaths are assigned to ICD10: O00-O99 codes regardless of time interval.

² Ratios based on deaths by race of decedent, live births by race of mother.
