		Three types of blood-forming cells in yolk sac
		Primordial germ cells
		Allantoic diverticulum
		Allantoic diverticulum
		Amnion with two cell layers
		Notochordal process
		Secondary villi
2 weeks, 4 days ï¿i ½		Foregut, midgut, and hindgut
		Uteroplacental circulation well established
		Prechordal plate with 1 retinal field
		Brain is first organ to appear
		Caudal eminence
		Neural ectoderm
		Neural groove and neural folds
		Neural plate induced by notochordal process
		Notochordal and neurenteric canals
		Notochordal plate
		·
		Connecting stalk
O oliva E davia Vit		Primitive pit (or notochordal pit)
2 weeks, 5 days I¿		Prechordal plate with 2 retinal fields
2 weeks, 6 days ï¿i ½	•	Numerous blood islands in umbilical vesicle
		Septum transversum (primitive diaphragm)
		Foregut
		Oropharyngeal membrane
		Pharyngeal pouch 1
		Stomodeum forming
		Beginnings of the heart can be seen
		Blood vessels emerge simultaneously in umbilical vesicle, embryo proper, amnion, and connecting stalk
		Common umbilical artery
		Dorsal aortae (paired)
		First pair of aortic arches
		Heart: Cardiogenic plate, cardiac jelly, myocardial mantle, and endocardial plexus
		Left ventricle, right ventricle, conotruncus
		Paired pericardial cavities
		Paired tubular heart
		Forebrain, midbrain, and hindbrain
		Hindbrain with four rhombomeres

www.ehd.org 3 of 37

	Mesencephalon (or midbrain)
	Neural cord within caudal eminence
	Neural groove deepens substantially
	Primary neuromeres
	Three main divisions of brain
	Cephalic and caudal folds
	Neural crest: Rostral and facial
	Primitive streak reaches neurenteric canal
	Somites with central somitocoels: Pairs 1 through 3
3 weeks ï¿ ½	Blood and blood vessels

Unit 4: 3 to 4 Weeks

3 weeks, 1 day ï¿	Thyroid primordium emerges from floor of pharynx
	Nephrogenic cord emerges (at 10 somites)
	Cloaca
	Common coelomic cavity divides into peritoneal, pericardial, and pleural cavities
	Liver: Hepatic plate (endoderm)
	Midgut emerging
	Pharyngeal arches 1 and 2
	Pharyngeal cleft 1
	Second pharyngeal cleft and pouch
	Pharyngeal groove and ridge with laryngotracheal sulcus
	Respiratory outgrowth
	Atria (right and left) far apart
	Bulbis cordis
	Circulatory system function begins
	Endocardial tubes fuse forming tubular heart
	Heart begins beating
	Pericardial sac
	Pericardium
	Primary head vein
	Sinus venosus
	Tubular heart begins folding
	Umbilical arteries
	Umbilical veins (right and left)
	Optic primordia fill neuromere D2
	Otic pits
	Chiasmatic plate
	Mesencephalic flexure
	Neural tube
	Neuromeres D1 and D2 (in diencephalon)

www.ehd.org 4 of 37

	Optic sulcus in forebrain
	Pontine region identifiable near cranial nerves VII and VIII
	Segment D in rhombencephalon
	Some secondary neuromeres
	Superior colliculus
	Telencephalon
	Telencephalon (or telencephalic) medium
	Body cavities
	Hyoid arch
	Mandibular arch and maxillary process
	Neural crest: Trigeminal, facioacoustic, glossopharyngeal-vagal, and occipitospinal
	Somites: Pairs 4 through 12
3 wooks 3 days ii ii	Primordial germ cells begin moving from umbilical
% weeks, 3 days 1212	vesicle to hindgut
	Thyroid complete
	Face: Maxillary and mandibular processes (bilaterally)
	Cloacal membrane
	Mesonephric duct emerges from nephrogenic cord
	Nephric vesicles
	Cystic primordium
	Hepatic diverticulum
	Liver
	Membrane between future mouth and throat may begin to rupture
	Angiogenesis along surface of central nervous system
	Aortic sac
	Atrioventricular canal
	Capillary plexus begins forming around brain and spinal cord
	Conotruncus
	Conus cordis emerging from right ventricle
	Endocardium
	Heart contractions produce peristaltic blood flow
	Internal carotid arteries
	Interventricular septum
	Primordium of myocardium
	Sinus venosus separating from left atria
	Trabeculated outpouches along primary cardiac tube representing primordia of left and right ventricles
	Trigeminal and otic arteries
	Facio-vestibulocochlear ganglia (CN VII, CN VIII)
	Glossopharyngeal and vagal ganglia
	Optic evagination (starting at 14 somites)
	- Para a ragination (ottaining at 11 dollinoo)

www.ehd.org 5 of 37

Otic vesicle Trigeminal ganglia (CN V) Neural crest: Optic crest emerges during Carnegie Stages 11 and 12 Nose: Nasal plate Optic vesicles form (17 to 19 somites) Adenohypophysial pouch Adenohypophysial Lamina terminalis Mesencephalon contains tectum and tegmentum Neural crest production and migration continue Neurohypophysial primordia Neuroppope (near brain) closes Notochord Segmentation of mesoblast alongside neural tube bilaterally ilaterally Somites: Pairs 13 through 20 3 weeks, 3 days - 5 weeks, 6i ½ ½ All eight rhombomeres (Rh 1 through Rh 7, Rh D) - Present in stages 11 through 17 3 weeks, 5 days ½ Telopharyngeal bodies Alimentary epithelium invades stroma of liver Alimentary epithelium proliferates in primordia of stomach, liver, and dorsal pancreas Gastric portion of foregut elongates (25 to 28 somites) Hepatic primordium with abundant vascular plexus Omental bursa Oropharyngeal membrane is ruptured Pharyngeal arch 3 Pharyngeal arch 3 Pharyngeal arches with dorsal and ventral parts Umbilical vesicle elongates Cervical sinus Laryngotracheal groove Lung bud Tracheo-esophageal septum Atrioventricular canal Common cardinal veins (right and left) Descending aorta Heart circulates blood to and from central nervous system, umbilical vesicle, and chorion Hepatocardiac channels (right and left) Rostral and caudal cardinal veins along brain and spinal cord feeding common cardinal veins

	Septum primum and foramen primum sometimes present
	Septum primum, foramen primum
	Sinu-atrial foramen prevents backflow into sinus venosus
	Sinus venosus collects veinous blood from entire embryo
	Superior vena cava, inferior vena cava, and sinus venosus collecting all venous blood
	Unidirectional circulation
	Vitelline arteries and veins
	Hypoglossal cord (CN XII) enters pharyngeal arch 4
	Otocyst nearly closed
	Nasal discs form part of ectodermal ring
	Optic vesicles covered by sheath (formed by mesencephalic and optic crest)
	Brain involves 40% of neural tube
	Brain: Embryonic commissural plate
	Ectodermal ring complete
	Hypoglossal nucleus (CN XII)
	Lowermost spinal cord formation begins
	Mamillary recess
	Marginal layer in rhombencephalon
	Mesencephalic flexure at 90 degrees
	Mesencephalon with two neuromeres: M1 and M2
	Motor neurons in basal plate of rhombencephalon
	Neural tube closes (lower back)
	Neurofibrils form in rhombencephalon
	Primary neurulation ends
	Primordia of ventral thalamus and subthalamus in diencephalon
	Sulcus limitans
	Sulcus limitans in midbrain
	Somites: Pairs 21 through 29
	Upper limb primordium at level of somites 8 to 10
	Progressively C-shaped embryo
4 weeks از ا 2 ½ 4 weeks از از	Spleen primordia
	Thymic primordia
	Lower lip forms from merging of mandibular processes
	Melanoblasts in epidermis
	Skin is so thin, you can see through it!
	Gonadal ridge extends from C-7 to T-8 levels
	Primordial germ cells migrate to mesonephric ridges
	Primordial germ cells number several hundred
	Urorectal septum

Thyroid bilobed and attached to pharynx by thryoglossal duct
Diaphragm primordia
Glomeruli emerge in mesonephros
Mesonephric duct attached to cloaca
Nephric tubules now S-shaped
Urogenital sinus
Urorectal cleavage line
Diverticulum ilei marks division between foregut and hindgut
Esophagus primordia
Intestines growing in length
Mesentery from end of duodenum to proximal half of colon
Opening between gut and umbilical vesicle decreases
Pancreas: Ventral pancreas
Pharyngeal pouches 1 through 4
Pharynx
Pleuroperitoneal canals
Small & large intestines
Stalk of umbilical vesicle lengthens and narrows
Stomach assumes shape of a spindle
Umbilical vesicle at height of development
■ Vitelline duct
Bronchial buds
Lungs begin filling chest cavity
Mesenchyme from coelomic epithelium surrounds esophagus and lung buds
Trachea
Anterior, middle, and posterior cerebral plexuses
Aorta branches include dorsal intersegmental, lateral segmental, and ventral segmental arteries
Aortic arches 4 and 6
Artery from the common iliac artery feeds each lower limb bud
Atrioventricular bundle
Cardiac contractions still under myogenic control
Celiac artery, superior and inferior mesenteric arteries
Circulatory system "well established"
Common iliac arteries (right and left, from dorsal aorta bifurcation)
Contractions well coordinated and sequential from sinus venosus to atria to ventricles
Functioning two-chamber heart
Gas exchange through placenta begins
Gelatinous reticulum (or cardiac mesenchyme)
Heart chambers bulging with fluid
3 3

www.ehd.org 8 of 37

	Heart now functions as two parallel pumps
	Heart rate (about) 113 beats/min
	Heart: Atrioventricular cushions (rostroventral and caudodorsal)
	Heart: Myocardium wall 3 to 4 cells thick
	Primary head veins (right and left) drain anterior, middle, and posterior cerebral plexuses and feed precardinal veins
	Small arteries emerging throughout mesoderm
	Ventricle walls trabeculated
	Vertebral arteries
	■ Vitelline veins empty exclusively into hepatic plexus
	Most cranial nerve ganglia
	Trigeminal, glossopharyngeal, and vagal preganglia
	Basement membrane of otic disc surrounds otic vesicle
	Endolymphatic appendage
	Otic invagination
	Otic vesicle closes
	Terminal-vomeronasal neural crest
	Brain: Commissural plate
	Cerebellum
	Common afferent tract
	Fourth ventricle
	Interstitial nucleus (part of medial longitudinal fasciculus)
	Isthmus rhombencephali (a new neuromere)
	Oculomotor (CN III) and trochlear nuclei (CN IV) in mesencephalon (midbrain) and isthmus respectively
	Retinal and lens discs
	Amnion surrounds connecting stalk and vitelline stalk
	Amnion surrounds embryo
	Cervical flexure
	Hyoid arch sudivides into dorsal and ventral segments
	Limb buds - the first sign of arms and legs
	Lower limb buds
	Umbilical cord emerging
	Upper and lower limb buds
Unit 5: 4 to 5 Weeks	
4 weeks, 3 days تائے 1⁄2 ½	
4 weeks, 3 days - 5 weeks تزاز 2 ½	Germ cells migrate to gonads
4 weeks, 4 days تخ آخ ½ ½	Thymus

www.ehd.org 9 of 37

Parathyrogenic zones
Thyroglossal duct
Thyroid pedical lengthens
Dorsal contour develops depression at level of sclerotomes 4 and 5
Muscular plates between upper and lower limb buds
Glomerular capsules, partially vascularized
Mesonephric corpuscle
Metanephrogenic cap emerges from ureteric bud Ureteric buds
Angiogenesis within peri-esophageal mesenchyme
Epiploic foramen
Lesser sac (omental bursa)
Small intestine forming coils
Tongue: Hypopharyngeal eminence
Arytenoid swellings (right and left)
Capillary network surrounds pulmonary mesenchyme
Epithelial lamina of larynx
Lungs: Right and left primary (or main stem) bronchi
Mesenchyme covering esophagus and respiratory tree separates
Mesenchyme surrounds bronchi
Pleura (mesothelium) surrounds part of mesenchyme
Right main bronchus longer than left
Atria walls thin, ventricle walls thick and trabeculated
Atrioventricula cushions not fused
Common pulmonary vein drains pulmonary plexuses into left atrium
Conotruncal ridges or cushions (remnants of cardiac jelly)
Epicardium
Left subclavian artery feeds left axillary artery, left vertebral artery, and and left thyrocervical trunk
Outflow tract still with one lumen
Posterior communicating arteries
Pulmonary arch (sixth aortic arch) forms from aorta and aortic sac
Pulmonary capillary network fed by pulmonary arteries, drain into left atrium
Sinu-atrial (SA) node
Superior mesenteric artery and vein
Upper limb buds with early marginal blood vessel
☐ Brachial plexus
Cervical plexus
Dorsal roots
Hypoglossal nerve roots unite (CN XII)

www.ehd.org 10 of 37

Lens and retina invaginate to form optic cup
Primordium of cochlear duct
Rami communicantes
Spinal nerves reach muscle primordia
Upper limb buds innervated
External ear: Auricular hillocks merging
Eyes located on sides of head
Lens pits
Lens vesicle open to surface (lens pore)
Nose: Nasal pits
Nose: Nasal plate (or disc) flat or concave
Pigment in retina (external layer of optic cup)
D1 and D2 no longer identifiable within diencephalon
75% of midbrain covered by marginal layer
All 16 secondary neuromeres
Brain enlarges 50% since Carnegie Stage 13
Brain: Cerebral hemispheres appear and begin rapid growth
Brain: Lateral ventricles
Cerebellum with intermediate and ventricular layers
Cerebellum: Primordium found in alar plate of rhombomere 1
Corpora striata primordia connected by commissural plate
Cranial nerve 3
Di-telencephalic sulcus
Dorsal and ventral thalami
Dorsal funiculus
Hypothalamic sulcus
— Hypothalamus
Mamillary region
Medial and lateral longitudinal fasciculi
Median ventricular eminence
Pontine flexure
Preoptic sulcus extends between optic evaginations
Preoptico-hypothalamo-tegmental tract
Primary meninx surrounds most of brain
Rhombic lip
Spinal cord wall with three zones: ventricular (ependymal) zone, mantle (intermediate) zone, and marginal zone
Subthalamus with medial striatal ridge emerging
Synencephalon
Tegmentum
Tentorium cerebelli, medial portion

www.ehd.org 11 of 37

•	Terminal-vomeronasal crest contacts brain (olfactory area)
	Torus hemisphericus (TH)
	Velum transversum
	Ventral longitudinal fasciculus
	Ventral segment of hyoid arch subdivides
4 weeks, 5 days تزاز تا این الاستان علی الاستان الاست	Primordium of antitragus emerges from ventral subsegment of hyoid arch
	Gonad framework found in coelomic epithelium
	Thyroid detached from epithelium of pharynx in some embryos
	Lower limb bud rounded proximally and tapered distally
	Mesenchymal skeleton in upper and lower limbs
	Right and left neural processes
	Sclerotomic material around notochord (rhombomere D level)
	── Vertebrae well defined
	Vertebral centra
	Primary urogenital sinus
	Ureteric bud extends to pelvis of the ureter
	Bladder and rectum are separating caudal to ureters
	Caecum
	Dense mesenchyme surrounds much of gastrointestinal tract
-	Esophagus elongates, passes dorsal to carina and between main stem bronchi
	Gall bladder and cystic duct
	Liver: Hepatic ducts
	Ventral pancreas appears as an offshoot of the cystic duct
	Lobar bud swellings denote areas of secondary bronchi
•	Remnants of coelomic epithelium forming visceral pleura
	Atrioventricular cushions apposed
•	Blood flow divided into right and left streams through atrioventricular canal, ventricles, outflow tract, and aortic sac
	Blood vessels penetrate diencephalon
	Capillary plexus surrounds esophagus
	Capillary plexus surrounds lung buds
	Cardiac mesenchyme surrounds ventricles and outflow tract
	Coronary arteries (terminal end)
	Foramen secundum begins in septum primum
	Left ventricle with thicker walls and greater volume than right

www.ehd.org 12 of 37

Right subclavian artery originates from brachiocephalic artery and feeds right thyrocervical trunk and axillary and vertebral arteries
Semilunar cusps
Capsule present around lens
Corneal epithelium overlying optic cup
Ear: Endolymphatic duct
Geniculate and vestibulocochlear ganglia separating
Lens body now present containing some lens fibers
Lower limb buds innervated
Optic stalk
Utricle, endolymphatic duct, and endolymphatic sac
Utriculo-endolymphatic fold
External ear primordia emerges from caudolateral portion of mandibular arch
Face: Lateral and medial nasal processes bilaterally
Lateral nasal processes along dorsolateral lip of nasal pits
Lens vesicles closed, pores absent
Nose: Nasal discs recede forming nasal pits
Optic chiasm
Adult lamina terminalis
Amygdaloid area
Brain with five main sections
Cerebellar plate
Cerebellum with marginal layer
Fibers of dorsal funiculus reach level of C1
First axodendritic synapses in cervical spinal cord
First nerve fibers
Habenular nucleus
Habenulo-interpeduncular tract
Lateral striatal ridge (derived from telencephalon and comprised mainly of neostriatum)
Lateral ventricular eminence
Locus caeruleus
Longitudinal zones in diencephalon
Marginal layer throughout most of diencephalon
Material for sympathetic trunks scattered in cervical region
Median striatal ridge (paleostriatum)
Mesencephalic tract of CN 5
Most cranial nerves seen
Olfactory fibers reach brain
Optic groove (also called preoptic recess)
Postoptic recess
Primordium of epiphysis

www.ehd.org 13 of 37

	Rhombomeres still identifiable
	Superior colliculi and its commissure
	Superior medullary velum
	Supramamillary commissure
	Synapses among motor neurons in spinal cord
	Tectobulbar tract
	Tentorium
	Third ventricle
	Trigemino-cerebellar tract
	Trochlear nerve root and decussation (CN IV)
	Hand plate emerges from distal upper limb bud
	Frontonasal prominence
5 weeks וّخ الخ 2/1 1/2	ACTH [adrenocorticotropin hormone]
	Growth hormone
	Pituitary gland
	Limb buds form hand plates
	Permanent kidneys
	Arytenoid and epiglottal swellings
	Bronchial tree branching accelerates
	Lobar pattern mimics adult pattern
	T-shaped laryngeal inlet
	T-shaped laryngeal inlet Pacemaker cells
	Pacemaker cells

Hand area with central carpal region and digital plate with marginal vein
Pre-chondrocranium: Otic capsule, nasal capsule, and parachordal condensations
Primordia of primary palate
Ribs: Primordia now present for all 12 pairs
Vertebral column with 36 levels of ganglia and myotomes
Extra-ocular premuscle masses receive cranial nerve fibers [oculomotor (CN III), trochlear (CN IV), and abducens (CN VI) nerves]
Gluteal mesoderm
Infrahyoid premuscle masses
Limb mesoderm
Sternocleidomastoid-trapezius premuscle mass with spinal accessory nerve (CN11)
Thigh and thigh mesoderm
Tongue premuscle mass
Metanephros at level of sacrum
Urethral plate
Lesser omentum (ventral mesogastrun)
Peritoneal cavity
Rectum
Stomach: Greater and lesser curvatures
Yolk stalk disappears
Bronchial tree expanding
Cervical sinus diminished in size
Epiglottis
Primitive Larynx
Anterior, middle, and posterior cerebral arteries
Atrioventricular (AV) node
Atrioventricular cushions fuse with interventricular septum
Circle of Willis almost complete
Conotruncal septum
Endocardial cushions (rostroventral and caudodorsal) begin fusing around atrioventricular canal forming right and left atrioventricular canals and two separate blood streams
External carotid artery
Foramen primum disappearing
Hepatic portal vein
Infundibulum of right ventricle
Jugular lymph sac
Lateral atrioventricular cushions
Mesencephalic artery
Myelencephalic artery

Archipallium, paleopallium, and neopallium Area epithelialis Brain: Primordial plexiform layer in area of future temporal lobe Cajal-Retzius cells Commissure of the trochlear nerve Diencephalic subthalamic nucleus Dorsal and ventral thalami separated by groove Dorsal funiculus fibers reach medulla oblongata	Alar lamina emerging with dense rhombic lip
 Area epithelialis Brain: Primordial plexiform layer in area of future temporal lobe Cajal-Retzius cells Commissure of the trochlear nerve Diencephalic subthalamic nucleus Dorsal and ventral thalami separated by groove Dorsal funiculus fibers reach medulla oblongata 	All cranial nerves identifiable
Brain: Primordial plexiform layer in area of future temporal lobe Cajal-Retzius cells Commissure of the trochlear nerve Diencephalic subthalamic nucleus Dorsal and ventral thalami separated by groove Dorsal funiculus fibers reach medulla oblongata	Archipallium, paleopallium, and neopallium
temporal lobe Cajal-Retzius cells Commissure of the trochlear nerve Diencephalic subthalamic nucleus Dorsal and ventral thalami separated by groove Dorsal funiculus fibers reach medulla oblongata	Area epithelialis
Commissure of the trochlear nerve Diencephalic subthalamic nucleus Dorsal and ventral thalami separated by groove Dorsal funiculus fibers reach medulla oblongata	
Diencephalic subthalamic nucleus Dorsal and ventral thalami separated by groove Dorsal funiculus fibers reach medulla oblongata	Cajal-Retzius cells
Dorsal and ventral thalami separated by groove Dorsal funiculus fibers reach medulla oblongata	Commissure of the trochlear nerve
Dorsal funiculus fibers reach medulla oblongata	Diencephalic subthalamic nucleus
-	Dorsal and ventral thalami separated by groove
Epiphysis cerebri	Dorsal funiculus fibers reach medulla oblongata
	Epiphysis cerebri

www.ehd.org 16 of 37

	Glial cells identifiable adjacent to neurons
	Greater petrosal nerve
	Hippocampus: Gyrus dentatus
	Infundibular recess and infundibulum
	Interventricular foramen large
	Marginal ridge
	Medial and lateral ridges of corpus striatum are continuous
	Median forebrain bundle
	Neurohypophysial outgrowth
	Olfactory tubercle
	Pontine flexure deepens
	Posterior commissure
	Recurrent laryngeal nerve
	Reticular formation more defined
	Retinal fissure closes
	Splanchnic nerve
	Sulcus limitans hippocampi
	Superior laryngeal nerve
	Second pharyngeal arch more prominent
	☐ Third pharyngeal arch recedes
5ï:1/, weeks ï: i:	☐ Initial tooth formation
1/2 WEEKS 12 12 1/2 1/2	Initial tooth formation
5� weeks - 6 weeks ï¿ï¿ ½½ ½	Subtle movement begins
5 weeks, 4 days تخ آخ ½ الم	Cartilage formation
5 weeks, 5 days تئ تئ 2 ½	Nerve cells differentiating
5 weeks, 5 days - 7 weeks, 1 إن لا 5 day ½	Melanocytes in epidermis
5 weeks, 6 days تزاز 2 الم	
	Genital eminence forms phallus or genital tubercle
	Gonad grows into oval shape with irregular surface
	Auditory ossicles identifiable in mesenchyme
	Cartilage in occipital sclerotomes (1-4)
	Digital rays in hand plate
	Femur: Chondrification begins
	Foot with rounded digital plate
	Hypoglossal foramen (or canal) through sclerotome 4
	(area of future occipital bone)

www.ehd.org 17 of 37

Odontogenic epithelium ermerges in six areas (four maxillary and two mandibular)
Primary palate components (right and left) fuse in midline
Primitive palatine groove
Primordium of cartilage within nasal septum
Control vertebral centra begin chondrification
Primordia of orbital muscles
Calices
Mesonephros can produce urine
Pelvis of the ureter with three main divisions
Vesico-urethral canal
Biliary ducts within liver
Dorsal and ventral pancreas fuse but retain separate ducts
Duodenum enlarges proximal to and distal to bile and pancreatic ducts
Esophagus developing a submucous coat surrounding epithelium
Intestinal loop begins umbilical herniation
Primordial vermiform appendix
Stomach regions include gastric canal, fundus, corpus (or body), and pyloric antrum
Trachea: Precursors of tracheal cartilages
Condensing mesenchyme around junction between left and right atria and cardiac tube is precursor to mitral and tricuspid valves
Outflow tract rotates counterclockwise
Right and left atrioventricular canals totally separated
All parasympathetic cranial nerve ganglia identifiable
All spinal nerves present
Cell islands in olfactory tubercle
Crescentic lens cavity
Geniculate ganglion separate from vestibulocochlear nerve
Globular process emerges from each medial nasal process
Nasal fin connecting nasal disc and surface epithelium
☐ Nasofrontal grooves
Olfactory tubercle with cellular islands
Hyomandibular groove enlarges (onset of concha and external auditory meatus formation)
Medial rims of nasal pits form nasal septum
Nostril becomes continuous with nasal sac
Primary lens fibers
Retinal fissure closed
Capillaries between adenohypophysis and
hypothalamus

www.ehd.org 18 of 37

	Commissure of the oculomotor nerves
	Cortical nucleus in amygdaloid body
	Dentate and isthmic nuclei in cerebellum
	Dura begins forming in basal area
	Epiphysis cerebri with intermediate layer
	First hint of septal nucleus
	Frontal and temporal poles of cerebral hemispheres
	Gustatory fibers separate from common afferent tract
	Hemispheric stalk
	Intermediate layer in tectum mesencephali
	Interventricular foramen
	Mesencephalon with intermediate layer
	Somites: Pairs 38 and 39
	Spinal cord reaches caudal tip of body
	Subarachnoid space
	Synapses in spinal cord between interneurons and primary afferent neurons
	Ventral thalamus with intermediate layer
	Anterior choroid artery
6 weeks ï¿ ï¿ ½ ½	Face withdraws from light touch around mouth
	■ Blood forming in liver
	Milk lines
	Nipples along side of trunk
	Adrenal glands
	Glucagon in pancreas
	Handplates develop subtle flattening
	☐ Joints
	Medial skull cartilages: Parachordal, hypophyseal, and trabecular
	Tooth buds (primary teeth)
	Diaphragm is largely formed
	Intestines fill base of umbilical cord
	External ears
	Synapses form in spinal cord
	☐ Crown-heel length 1.6 cm
Unit 7: 6 to 7 Weeks	
6 weeks, 2 days ï¿ i¿ ½ ½/2	Angiogenesis begins inside gonads
	Gonad grows into oval shape with irregular surface
	Ostium (abdominal) of uterine tube at rostral end of paramesonephric duct (in female embryos)
	Paramesonephric duct forms from rostral end of mesonephric duct

www.ehd.org 19 of 37

Testicular cords in gonads of male embryos
Testicular cords in male gonad
Elbow regions sometimes identifiable
Embryo with cervical and lumbar flexures
Embryo with dorsal concavity
Finger rays with early interdigital notching
Hands polygon-shaped
Humerus, radius, and ulna
Humerus: Chondrocytes in phases one through three
Scapula and clavicle
Semicircular ducts form in order: anterior, posterior, and lateral
Sternum: Episternal cartilage created from fusion of right and left sternal bars
☐☐ Tibia and fibula
Toe rays sometimes present
Deltoid muscle
External and internal abdominal oblique muscles
Levator scapulae muscle
Longus cervicis and semispinalis cervicis muscles
Pectoralis major muscles
Platysma muscle
Rectus abdominis muscle
Rectus capitus posterior and semispinalis capitis muscles
Serratus anterior muscles
Splenius and longissimus muscles
Stapedius muscle
"Common excretory duct is disappearing"
Cloacal membrane ruptures (stages 18-19)
Primordia of secretory tubules
Esophagus with muscular and submucous coats
Submandibular gland primordia
Bronchial tree with subsegmental buds
Bronchial tree with well established segmental bronchi
Lingula of left upper lobe
Aortic and pulmonary valves assuming shape of a cup
Brachiocephalic veins, right and left
Inferior vena cava
Interventricular septum: membranous part begins forming
Left coronary artery arises from aorta
Mesenchyme ridges in place of future mitral and tricuspid valves
Pulmonary and aortic blood flows completely separate

www.ehd.org 20 of 37

Secondary interventricular foramen sometimes closing (stage 18-21) interventricular septum
Septum secundum and foramen ovale (stages 18-21)
Bucconasal membrane
Bucconasal membrane detaches opening up nasal airway
Crus commune
Ethmoidal epithelium emerges from upper medial nasal wall
Frontonasal angle (marks location of future nasal bridge)
Mesenchyme thickenings mark beginning of "sclera and its muscular attachments"
Nasal tip emerges
Nerve fibers in retina
Optic fibers
Retina's outer lamina heavily pigmented
Vomeronasal nerve and ganglion
Vomeronasal organ marked by groove and located in fold of lower medial nasal wall
Choanae
Conjunctival sac marked by groove
Cornea and conjunctiva
Ear: Stapes primordium surrounds stapedial artery
External ear: Crus helicis forming from auricular hillocks two and three (from mandibular arch)
Eyelid folds sometimes present
Nasal fin splits forming choanae and bucconasal membrane
Nasolacrimal duct begins as epithelial strand emanating from nasomaxillary groove
Nostrils, nasal wings, and nasal septum easily seen
Olfactory bulb sometimes with olfactory ventricle
Primary lens fibers filling lens vesicle cavity
Adenohypophysis no longer open to pharyngeal cavity
Archistriatum
Brain: Dentate nucleus in internal cerebellar swellings
Brain: Pineal recess emerges representing anterior lobe of epiphysis
Brainwave activity has begun
Cerebrospinal fluid production begins
Choroid plexuses in fourth and lateral ventricles
Corpus striatum much larger extending to preoptic sulcus; has subtle groove
External cerebellar swellings contain future flocculus
Four amygdaloid nuclei
Fourth ventricle: Choroid folds

www.ehd.org 21 of 37

	Hippocampus reaches olfactory region
	Interpeduncular fossa
	Neurohypophysis walls are folded
	Nucleus ambiguus of the vagus (CN10)
	Prosencephalic septum
	Red nucleus
	Substantia nigra
	Supra-optic commissure
6� weeksï¿ï¿ ½½ ½	The hands begin to move
	Volar pads on palms
	Bones first form in the collar bones and lower jaw
6 weeks, 5 days ï¿ïز ½ ½	Greater thymic bud
	Cheeks form by merging of maxillary and mandibular processes
	Mammary gland primordium
	Mammary ridge disappears leaving only mammary gland primordium
	Female duct
	Gonads extend from levels T-10 to L-2
	Rete ovarii (in female embryos)
	Rete testis begins emerging from seminiferous cords (Stage 19-23) (in male embryos)
	Tunica albuginea in male embryos
	Suprarenal gland: Cortex
	Suprarenal gland: Medulla populated by prechromaffin cells
	Arms point forward
	Beginnings of occipital and sphenoid bones
	Bilateral cartilaginous sternal bars tie ribs together; sternal bars join cranially to form the episternal bar in the midline
	Cartilage within otic capsule envelops semicircular canals and cochlear duct
	Cartilaginous styloid process
	Ear: Cartilaginous malleus, incus, and stapes (the middle ear ossicles)
	Ectomeninx covers lateral and dorsal surfaces of brain (laying the foundation for the flat bones of the skull)
	Intervertebral discs form from caudal condensed portion of sclerotomes
	☐ Ischium and illium
	Labiodental lamina: Inner dental lamina and outer labiogingival band
	☐ Laryngeal cartilages

www.ehd.org 22 of 37

Limbs point forward (ventrally)
Orbitosphenoid cartilage located within ectomeninx near optic stalk
Ossification begins in maxilla (stages 19 -20)
Primitive palate (or intermaxillary segment)
Rib primordia become cartilaginous
Ribs each have an identifiable head and shaft
Trachea: Tracheal cartilage
U-shaped labiodental lamina form along upper and lower oral cavity
Vertebral column represented by cartilaginous centrum, neural arch, and short tranverse process
Esophagus: Muscularis layer adjacent to esophageal plexus
Gluteal muscle group
Iliopsoas muscles
Infrahyoid muscles
Internal intercostal muscles
Limb extensor muscles located dorsally
Limb flexor muscles located ventrally
Midgut: Muscularis
Muscle tissue forming around phrenic nerve within septum transversum portion of diaphragm
Pharyngeal constrictor muscle
Premuscle mass of the muscles of mastication innervated by mandibular nerve
Quadratus lumborum muscle
Rhomboid and scalene muscles
Sternocleidomastoid and trapezius muscles distinct and innervated by separate branches of spinal accessory nerve (CN XI)
Thenar and hypothenar eminences
Tongue forms from swellings in floor of pharynx
Tongue: Extrinsic muscles identifiable
Tongue: Intrinsic muscles identifiable
Transversospinal and erector spinae muscle groups
Upper limb flexors innervated by musculocutaneous, median, and ulnar nerves
Major calyces, cranial and caudal, with collecting tubules within metanephrogenic mass
Mesonephros extends from T-9 to L-3
Metanephros extends from T-12 to L-2
Renal capsule covers distal collecting tubules
Renal vesicles form in part of metanephros
Ureter forms from "proximal segment of metanephric diverticulum"
Urogenital sinus comprised of three parts: Bladder, pelvic, and phallic portions

www.ehd.org 23 of 37

Anal folds adjacent to anal membrane
Anal membrane
Duodenum: "Assumes the shape of an arc"
Greater omentum
Lateral palatine process
Liver: rapid growth, right side greater than left
Median mandibular groove disappears as mandibular processes merge in midline
Palatine fossa (from pharyngeal pouch 2)
Primitive oral cavity
Primitive rima oris replaces stomodeum
Stomach wall layers: Mucosa, submucosa, muscularis, and serosa
Submandibular and parotid gland buds
Submandibular gland duct
Bronchial tree: First generation of subsegmental bronchi complete
Glottis, primitive
Lung sac, right: Oblique and horizontal fissures define upper, lower, and middle lobes
Lung sac: Apex and base
Lung, left: Oblique fissure defines upper and lower lobes
"Septum primum fuses with endocardial cushions" obliterating ostium primum and creating the ostium secundum
Apex of left ventricle
Circulus arteriosus (Circle of Willis) complete
External iliac arteries
Iliac lymph sac
Intercostal and subcostal arteries
Internal thoracic artery and costocervical trunk
Mesenteric lymph sac
Mesonephric artery feeds mesonephros, gonads, and suprarenal glands
Papillary muscles
Pontine, superior cerebellar, and anterior and posterior interior cerebellar arteries replace myelencephalic and metencephalic arteries
Primitive marginal sinus drains diencephalon
Primitive tentorial sinus drains cerebral vesical
Primitive transverse and sigmoid sinuses
Pulmonary arteries (right and left)
Right coronary artery arises from aorta
Splenic vein
Tricuspid and mitral valves

www.ehd.org 24 of 37

Anterior chamber between iridopupillary membrane and thickened ectoderm
Auditory tube and primtive tympanic cavity form from tubotympanic recess pharyngeal pouch 1)
Celiac, superior mesenteric, and inferior mesenteric preaortic ganglia
— Choana
Cochlear duct tip grows upward
Esophageal plexus formed by vagal nerves (CN X)
Facial nerve (CN VII) branches: Chorda tympani, greater petrosal, posterior auricular, and digastric
Facial nerve (CN VII) reaches cervicomandibular region
Glossopharyngeal nerve (CN IX) innervates stylopharyngeus premuscle mass
Hypoglossal nerve (CN XII) innervates separating tongue muscles
Linguogingival groove
Nasolacrimal duct forms from maxillonasal groove
Nasolacrimal ducts extend from medial eyes to primitive nasal cavity
Nerve fibers begin extending from retina
Optic fibers enter chiasmatic plate
Primitive nasal cavity
Primordial vitreous body
Superior, middle, and inferior cervical ganglia
Trigeminal nerve (CN V) with opthalmic, maxillary, and mandibular divisions reach their destinations
Vagal trunks, anterior and posterior, extending into abdomen
Eyelids: Upper and lower lids present and growing
Saccule and cochlear duct
Adenohypophysis: Lateral lobes of pars tuberalis
Adenohypophysis: Pars intermedia emerging
Brain: Internal capsule formation underway
Cerebral hemispheres cover half of diencephalon
Dorsal and ventral cochlear nuclei
Fourth ventricle: Lateral recesses
Ganglion of nervus terminalis
Globus pallidus externus in the diencephalon
Habenular commissure
Intermediate layer in dorsal thalamus
Lemniscal decussation
Lower limb nerves (femoral, obturator, sciatic, common peroneal, and tibial) identifiable
Medial accessory olivary nucleus
Neurohypophyseal bud
Nuclei of forebrain septum

www.ehd.org 25 of 37

	Nucleus accumbens
	Occipital pole of cerebral hemispheres
	Optic stalk with barely discernible lumen
	Paraphysis marks dividing line in roof between telencephalon and diencephalon
	Primitive filum terminale
	Radial nerve innervates upper limb extensors
	Rhombomeres no longer distinguishable
	Subcommissural organ
	Zona limitans intrathalamica between dorsal and ventral thalami
6 weeks, 6 days تاز ½ لا	Feet polygon-shaped
	Cloacal membrane ruptures
7 weeks از از ½ 1/2	Head rotates
	Leg movements
	B lymphocytes in liver
	Ovaries
	Testes begin to differentiate
	Insulin in pancreas
	Foot plates notched
	Hiccups
	Tendons attach muscle to bone
	The heart has four chambers and is nearly complete.
	The heart rate peaks at 165 to 170 beats per minute.
	Crown-heel length 2.2 cm
Unit 9. 7 to 9 Weeks	Crown-neer length 2.2 cm
Unit 8: 7 to 8 Weeks	
7 weeks, 1 day ເປັນ ໃນ ໃນ ໃນ ໃນ ໃນ ໃນ ໃນ ໃນ ໃນ ໃນ ໃນ ໃນ ໃນ	Facial processes no longer distinguishable
	Ovaries full of primitive oogonia, intermediate pregranulosa cells, and mesenchyme
	Testes with short straight tubules
	Upper limbs with slightly flexed elbows
	Diaphragm: Central tendon
	Renal vesicles with S-shaped lumina
	Submandibular gland: Solid epithelial ducts enlarge and begin to branch
	Adenohypophysis with new capillaries on rostral surface
	Scalp vascular plexus
	Cochlear duct tip growing horizontally
	Lens cavity completely filled
	Optic commissure
	1 . 7 - 2 - 1

www.ehd.org 26 of 37

	Optic fibers extend to optic chiasma
	Cornea with three layers
	Brain: Inferior colliculus (in mesencephalon)
	Cerebral hemispheres expand beyond lamina terminalis
	Cerebral hemispheres extend over two-thirds of diencephalon
	Interpeduncular groove
	Medial septal nucleus
	Nigrostriatal fibers
	Nucleus of diagonal band
	Sacrocaudal spinal cord formation (secondary neurulation) complete
	Sensory pathways: Cuneate and gracile decussating fibers
	Septum verum
	Spinothalamic tract
7 weeks, 1 day - 8 weeks تئ تئ ½ ½	Stomach: Folds in stomach wall
7 weeks, 2 days ïز تا 2 ½ ½	Arteries and veins of heart complete
7 weeks, 3 days تئ آئ 2 ½	Volar pads begin to emerge on fingertips
	Chandragrapium with dargum colleg and hypophysial
	Chondrocranium with dorsum sellae and hypophysial fossa

	Corobral hamisphares source 75% of disposability
	Cerebral hemispheres cover 75% of diencephalon
	Cerebral hemispheres cover more than half of diencephalon
	Cortical plate within primordial plexiform layer
	Glial and neurilemmal (Schwann) cells within cranial nerves
	Global pallidus internus
	Internal fiber layer of cerebellum
	Lateral olfactory tract
	Primordium of dentate nucleus
	Pyramidal cells in hippocampus
	Subthalamic nucleus proper, entopeduncular nucleus, and globus pallidus externus within subthalamus
	Sulcus transversus rhombencephali
	Ventral part of lateral geniculate body
7� weeksï¿ï¿ ½½/₂	Hands begin to touch face
	The hands touch each other as do the feet!
	Fingertips thicken
	Plantar pads toes
	EKG pattern similar to adult
7 weeks, 4 days ï¿iز ½ ½	The fingers are free
7 weeks, 5 days ï¿ ï¿ ½ ½	Bone-forming cells called osteoblasts emerge
	Bone-forming cells emerge
	Endolymphatic and jugular foramina
	Hands can reach one another and fingers can overlap
	Optic foramen, foramen rotundum, internal acoustic foramen
	Costeoblasts emerge
	Pelvis: Obturator foramen
	Obturator internus muscles
	Rectus femoris muscle
	Large glomeruli present within metanephros
	Submandibular gland: Secondary branching with lumen formation starting at oral end of duct
	Costodiaphragmatic recess of pleural cavity
	Chordae tendineae (Stages 22 and 23)
	Intradural veins (sinuses)
	Scalp vascular plexus 75% of the way to the vertex
	Cochlear duct's second loop growing upward
	Scleral condensation
	Tragus and antitragus taking shape

www.ehd.org 28 of 37

	Eyelids continue growing rapidly over the surface of the cornea
	Optic nerve acquires a sheath
	Brain: Claustrum
	Brain: Cortical plate within cerebral hemispheres
	Brain: Internal capsule with connections to epithalamus, dorsal thalamus, and mesencephalon
	Brain: Putamen
	Cerebral hemispheres cover 75% of diencephalon
	Commissural plate thickens
	Cortical plate expanding rapidly
	Folds in roof of third ventricle
	Nerve fibers between neopallial subplate and internal capsule
	Thalamocortical fibers
7 weeks, 6 days ïز تز ½ %	The toes are free
8 weeks ï¿i¿ ½ ½	Complex response to touch
	More frequent hand-to-face contact
	Mouth opens & closes
	Squinting
	The embryo floats and rolls over in the womb
	Hairs first appear in eyebrows & around mouth
	Skin multi-layered, loses transparency
	Ductus deferens
	Interstitial cells forming within testis
	Testicular tubules
	Male embryos are making testosterone already!
	Anterior inferior iliac spine
	Costal cartilage
	Enamel organ
	Femur: Head and acetabular fossa
	Glenoid fossa
	Greater trochanter
	Head of humerus
	Inguinal ligament
	Joint development: Cavitation underway in hip, knee, and ankle (in some embryos)
	Joint development: Cavitation underway in shoulder, elbow, and wrist (in some embryos)
	Nucleus pulposus (from notochord)
	Ossification underway in scapula and distal phalanges in some embryos
	Pubic symphysis

www.ehd.org 29 of 37

Scapular spine and notch
Skull: Foramen magnum (wide)
Skull: Ossification underway in some embryos
Superior and inferior pubic rami
The embryo's joints are similar to adult joints
Ulna: Styloid process and olecranon
□ Vertebrae cartilaginous (33 or 34 in number)
Anterior digastric muscles
Depressor anguli oris muscle
Diaphragm complete
Esophagus: Longitudinal muscles
Obliquus superior capitus muscle
Obturator externus, gluteus maximus, and hamstring muscles
Posterior belly of the digastric muscle
Psoas tendon
Rectus sheath with anterior and posterior lamina
Temporal and lateral pterygoid muscles
Zygomaticus major muscle
Kidneys at level of first three lumbar vertebrae
Metanephros: Numerous large glomeruli
Metanephros: Secretory tubules elongating and becoming convoluted
Sinusal tubercle
U rethra
Urine production and release
Gastrolienal ligament
Nerves reaching intestinal loop
Peristalsis in large intestine
Submandibular gland: Lumen present in terminal portions of duct
Submandibular gland: Mesodermal sheath surrounds gland
Unfused uvula (edge of unfused palatine shelf) and secondary palate
Cccasional breathing motions begin
Pseudoglandular stage begins
Azygos vein
Blood supply to the brain closely resembles adult pattern
Hemiazygos veins
Inferior epigastric artery
Inferior vena cava valve at junction of right atrium
Scalp vascular plexus nearing vertex
Submandibular glands: Angiogenesis begins around epithelial tree (ducts)
. ,

www.ehd.org 30 of 37

Superior sagittal sinus
Cochlear duct's 2.5 coils nearly complete
Cranial nerve distribution mimics adult pattern
Ear drum
Eye: Secondary vitrous body
Lens: Secondary lens fibers emerging
Retina: Eight layers present
Retina: Four of the ten adult layers present
Tympanic membrane
Eyelids fusing laterally and medially
Optic tract reaches ventral portion of lateral geniculate body
"The hindbrain "presents striking resemblance to that of the newborn."
"The rhombencephalonpresents striking resemblance to that of the newborn."
Amygdala area
Brain represents 43% of embryo
Brain: Caudate nucleus and putamen within corpus striatum
Cerebellar commissures
Cerebellum with external germinal layer
Cerebral hemispheres cover lateral portion of diencephalon
Choroid plexus now lobular
Cortical plate covers nearly all of neopallial surface
Dura lines entire vertebral canal
Fasciculus cuneatus and fasciculus gracilis form the decussation of the medial lemnisci
Greater palatine nerve
Grey and white matter
Hippocampus reaches temporal pole
Inferior and superior cerebellar peduncles
Most cisterns present
Principal nucleus of inferior olivary nuclei
Pyramidal decussations
Right- and left-handedness emerges
Suprapineal recess
Suprascapular nerve
Vermis of cerebellum
Crown-heel length 4.3 cm
Embryo contains approximately 1 billion (10^9) cells
☐ Embryonic Period Ends
The 8-week embryo has formed more than 4,000 permanent body parts.

Unit 9: 8 to 9 Weeks	
	Humerus: Bone marrow replaces cartilage
1/2 1/2	The state of the s
8 weeks, 1 day - 9 weeks ï¿ ï¿	
1/2 1/2	
عن ½ weeks ن ال	Eyelids completely fused
1/2 1/2	
	November 1 and 1 and 1 and 1 and 1 and 1
O weeks ": ".	Neurons synapse in cerebral cortex (marginal zone)
9 weeks 1212 1/2	Bends hip & knee if sole of foot touched
	Drinking fluid is becoming routine
	Sucking the thumb
	The young fetus now sighs, stretches, moves the head, opens the mouth, and moves the tongue
	Tongue movement
	Female fetuses have early reproductive cells in their ovaries
	Thyroid gland weighs 2 grams
	Small intestine peristalsis
	External capsule
	Face, hands, and feet sense light touch
	Olivary nucleus with five components
Unit 10: 9 to 10 Weeks	
9 weeks - 10 weeks نزن ½ ½	
	Larynx recanalizes
	☐ My weight will rise more than 75% this week
9ازئ weeks از از 2/2 برائد	I yawn when I want
9 weeks, 4 days از ئ ½ %	Yawns
ئاخ: 10 weeks 2 مرادع	Eyes roll downward reflexively
	Palatine tonsils
	Fingernails and toenails begin to grow!
	Three-layered epidermis
	Tiny unique fingerprints have arrived!
	Now, all the bones are getting harder
	Tooth buds (secondary teeth)
	Glomeruli formation begins
	Physiologic herniation ends

www.ehd.org 32 of 37

	Commissure of the fornix
	Corpus callosum begins
	Crown-heel length 7.5 cm
Unit 11: 10 to 11 Weeks
